**THE OZONE SAFE OPTION FOR RESIDENTIAL/
COMMERCIAL COMFORT COOLING NEEDS.**

THE OZONE SAFE OPTION

FROM ICOR INTERNATIONAL, INC.

Why is the cost of maintaining your A/C system on the rise?

The U.S. Clean Air Act Amendment has imposed a number of rules and regulations on the production, handling and use of ozone depleting substances like those used in comfort cooling systems. One of those refrigerants, R-22, has been used for several decades and is now scheduled for complete phase out in the U.S. It is this phase out that is driving up the cost of R-22 system service and repairs.

What options do equipment owners have?

- Install a new ozone safe system. Depending on the application, this can be extremely expensive and in some cases virtually impossible.
- Easily convert your existing system over to NU-22B.

How Easy is it and why?

- NU-22B is an ozone safe, nontoxic, nonflammable refrigerant that is designed for use in R-22 systems.
- NU-22B is compatible with all system lubricants, unlike some R-22 alternatives.
- NU-22B is compatible with all standard system components.
- NU-22B doesn't require any major system modifications.

**Save time, money and do your part to
reduce ozone depletion. Convert your
comfort cooling system to NU-22B today!**

**System conversions should be
performed by qualified technicians only.**
